

ABSTRACT

The invention consists of a microwave oven driven milk boiling device, which serves to boil natural milk, powdered milk, or similar beverages, or to make chocolate milk, cappuccino or coffee with powdered milk, or even to boil water, all under pressure. In addition, it is useful to serve directly to the table. The milk is boiled in the lower container, which has a safety valve, and conveyed to another container above the boiling container. The milk or other beverage may be boiled within a period of 2 minutes, depending on the microwave oven used.
